

Srp_Act31

✅ Activity31 : Book Record – Display Only (SRP Simple)

🧠 Scenario:

You're creating a small console program for a librarian to **enter book details** and **display them in a clean format**.

Currently, a single class is handling:

- storing data
- formatting the book info
- printing the output

That's too much responsibility for one class. You'll fix this using SRP.

🔧 Instructions:

1. Create a `Book` class to store the book's `title`, `author`, and `year`.
 2. Create a `BookFormatter` class to return a string like:
`"The Alchemist by Paulo Coelho (1988)"`
 3. Create a `BookDisplay` class that prints the formatted string to the screen.
-

Note:

- *Give me your best output*
- *Add what you think is needed*
