Python Activity#1.2

Exercise 2: Working with Variables and Simple Calculations

Objective:

- Use **variables** with different data types (**string, integer, float, boolean**).

- Perform **basic mathematical calculation**.

- Print information in a **structured format**.

Instructions:

1. Declare variables for:

    - **Full Name** (string)

    - **Birth Year** (integer)

    - **Current Year** (integer)

    - **Average Daily Water Intake in Liters** (float)

    - **Drinks Coffee Daily** (boolean)

2. Calculate and print the **user's age** based on the birth year.

3. Print all details in a structured format.
